6.PRECAUTIONS

- When measuring capacitors without prior discharge, sparks may occur at the moment of insertion and locking, which can discharge the capacitor. This function serves as a safety measure to prevent forgetting to discharge capacitors before testing. However, it is still recommended to manually discharge capacitors before testing for proper usage.
- During non-measurement processes, the 1-2-3 locking interface is in a conductive state, which prohibits direct insertion of batteries.
- Testing component parameters outside the specified range may result in incorrect identification of component types.
